A B-cell superantigen (8Ag) is a fragment of SpA D domain that specifically binds the Pab Portion of variable region restricted antibodies. The SAg is used to enhance production of VH, especially antibodies. The SAg is used to enhance production of VH, especially WH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Iq reactive with mod-SpA, and as and obtained from combinatorial libraries were determined. 19M protein RIV is derived from the germline configuration of a VH gene
                                                                                                                                                                                                                                                                                                                                                                                         Query Match

Mean 40.399; Variance 101.115; scale 0.400 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A B-cell superattion (349) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAG is used to enhance production of VH, especially VH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Ig reactive with mod SpA, and as and DNA sequences (R54802-16, Q64812-56) of VH regions of SpA binders obtained from combinatorial libraries were determined. IgM protein KAS is derived from the germline configuration of a VH gene
                                                                                                                                                                                                                                                                                                                                                          84 yaqkiqgrvtitadeststaymelsslrsedtavyycardngaycsggscysqwfdpwgq 143

additional N-linked glycosylation sites are introduced at locations which impair complement fixing and Fc receptor binding abulity. They are preferably located in the CH2 region of the Iq molecule. Antibodies bearing multiple sialyl-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury. Sequence 481 AA:
                                                                                                                                                                                                                                                                                                 25 qvqlv-qsgaevkkpgssvkvsckasggtfssyaiswvrqapggglewmggiipifgtan 83

(HAV) sero positive patient. Antibody D is closely related in nature to murine antibody BSB3. Total RNA was isolated from antibody D expressing cells and polyademylated RNA was extracted. These polyA RNA's were used to prepare a cDNA library which was screened for human kappa light (L) chains and two positive clones were detected. Further heavy (H) chain clones were also isolated. Sequence 476 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Fig 2; 35pp; English.
The sequences given in R31023-24 represent the heavy and light chains of Antibody D respectively. Antibody D is a monoclonal antibody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       79 ysqnfqgrvtitadkststahmeltslrsedtavyycatdryrqanidrarvqwidpwqq 148

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This polypeptide sequence comprises the heavy chain variable region (YR), HBBI, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hCBA) specific antibody CEA6 (see W19881). A claimed specific binding member (A) comprises an hCBA specific antibody antigen binding domain that has a dissociation constant for hCBA of lass than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 cextracellular domain of hCBA and/or to cell-associated hCBA over hCBA over soluble hCBA. Preferred (A) include pairings of VH and VL variants (see W19886-95) obtained by a swell as CBA6 VH and VL variants (see W19886-95) obtained by comparenesis or chain shuffling. An example of a claimed pairing is HBBI1 VH with CEA6 VU. (A) is used to detect cells expressing hCBA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 60 yaqkfqqrltitadeststaymelsslrsedtavyycarhnhny--elyyy--ymdvwqq 115

```
This polypeptide sequence comprises the heavy chain variable region (WH), HBAIL, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hCBA)-specific antibody CER6 (see W19881). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 to with human liver cells, and preferentially binds to the A3-B3 to CEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA17 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. (A) is used to detect cells contagned cancer, e.g. adendrationma of the rolon, lung or breact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            60 yaqkfqgr1titadeststayme1ss1rsedtavyyca-gans-cnrsyyy--ymdvrgq 115

Claim 4; Fig la; 128pp; English.
This polypeptide sequence comprises the heavy chain variable region (VH) of human carcinoembryonic antique (hCEA)-specific antibody CEA6. WH 772125-25, and VL (T72138-55) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see W19876-85).

Specific antibody antigen binding member (A) comprises an hCFA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferred 10 -8 M, is non-cross-reactive with human liver cells, and preferred 10 -8 M, is non-cross-reactive with human liver cells, and preferred 10 -8 M, is non-cross-reactive cells and preferred (A) include pairings of VH and CML and VL well as soluble hCEA. Preferred (A) include pairings of VH and VL wariants (see W19876-55) obtained by mutagenesis or chain shuffling. An example of a claimed pairing is HBBS VH with CEAS VL. (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tymour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              60 yaqkfqgrltitadeststaymelsslrsedtavyycaqrshty--elyyy--ymdvwqq 115

A claimed specific binding member (A) comprises an hCBA specific antibody antigen binding domain that has a dissociation constant for hCBA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCBA and/or to cell-associated hCBA over
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Specific binding members for human carcinoembryonic antigen - bind to the A3-B3 extracellular domain of hCEA and are substantially non-cross-reactive with human liver cells; used for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Secre 591, DR 23, Imegith 123, Pred, No. 1,286+39.

A human anti-Varicocalla coster virus monoclonal antibody was prepd.
using the trioma method of Ostberg et al. (1983) Hybridoma 2:351-357.
One resultant trioma neutralised VZV in the absence of complement.
This call line, designated cell line TG93RAP, produced an antibody genes cell line, designated 93RA9 cpNA, for the light and heavy chain variable region heavy chain (gamma-1) and two light chain (kappa) specific clones sequence 147 AA;

hoPA over soluble hCBA Preferred (A) include pairings of VH and VI sequences from CBA1-7 (see W19976-85) or their CDP sequences. as well as CBA VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. Examples of claimed pairings are lifetio VH with locklic or CBA5 VL. (A) is used to detect ceils expressing hCBA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g adenorarinoma of the colon, lung or breast

same type as the patient's tumour; (c) removing extraneous antibodies by absorption against normal human cells; (d) cloning the phage selected in step (b) and (c); (e) assaying the specificity of the cioned phage by incubating the phage with at least two types of cultured normal cells; and (f) further testing the specificity of cloned phage that do not bind to either cell line of cultured normal cells;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to cultured tumour cells derived from more than one other tumour that is not the patient's tumour. The present sequence represents a human heavy chain antibody, from a VH antibody fusion phage library, produced by a method as described above. The antibodies produced can be used for diagnostic and therapeulic applications and for isolating tumour antigens for studying tumourigenesis or for use as anti-cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 19; Page 75-76; 82pp; English.

A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at least one fusion phage library from the peripheral blood lymphocytes (PBLS) of a cancer patient; (b) screening for anti-tumour antibodies in the phage library in a binding assay with cultured tumour cells of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MAbs). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                67 rvtitadkststaymelsslrsedtavyyca····r··gggr·ydaf·diwgggtlvtvs 118

A B-cell superantigen (sAg) is a fragment of SpA D domain that specifically binds the Fab portion of Variable region restricted antibodies. The sAg is used to enhance production of VH, especially VH3, restricted Abs. During attempts to identify sAgs, as sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N.P.D.S. 022419.
Immunoglobulin trans:genes - for prodn. of heterologous Inmunoglobulin trans:genes - for prodn. of heterologous non-rearranged and/or rearranged ig chains
Example 14; Page 87; 172pp; English.
The human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VH1 family specific oligonoucleotide (see 022418). Phage clone lambda 49.8 was isolated and a 6.1 kb XbaI fragment cong. the variable segment VH49.8 subcloned into pNN03 to generate plasmid pVH49.8.
An 800 bp region of this insert was sequenced. VH49.8 was found to have an open reading frame which encoded the sequence shown.
(R72070) (Q89328). The DNA (Q89329) and corresp amino acid (R72070) sequences of the VH region of a representative clone, OP7H1.2, are provided. Sequence 98 AA;
                                                                                                                                                                                                                                                                                                                                                                                        17-AUG-1992 (first entry)
Protein encoded by the human heavy chain V region gene VH49.8.
Heavy chain; variable region; VH1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 560; DB 4; Length 117;
